The Best Oxycodone Detox Center in Ohio

Oxycodone is a powerful painkiller and is found in OxyContin or Percocet. In recent years, Oxycodone abuse in Ohio has become more of a problem. It is currently the most commonly abused prescription drug in the state of Ohio, yet most take it without this intention. It is a powerful pain-relief drug that helps many suffering from severe pain or terminal conditions and gives them much needed relief and respite. Whether someone has been in a car accident or has had a bad injury, it is a good drug for while they heal and to make the process much more comfortable. Unfortunately, it is also highly addictive. As people's bodies become accustomed to their prescribed amount, they find themselves building up a tolerance and needing a higher dosage for the same relief. This is where many start to become addictive and can quickly spiral out of control.

What are the main types of Oxycodone-based drugs?

Oxycodone is often prescribed in different forms, so you might not be necessarily aware this is what you are taking. Three of the most common forms are OxyContin, Percocet, and Roxicodone. The effects of using them include reduced anxiety, increased confidence, relaxation, calmness, euphoria, and happiness, which are just a few of the reasons that so many people find themselves become addicted and reliant on it to get them through the day.

The DEA classifies drugs such as Oxycodone as a Schedule II controlled substance, which is highly regulated and cannot be obtained without a prescription from a medical professional. Its distribution is also monitored closely by the federal government to control the amount it is prescribed. Despite this, many still find themselves becoming reliant on Oxycodone and the elation and the relaxed way it makes them feel. If you suspect you or someone you know is becoming addicted to Oxycodone, it is vital to get help as soon as possible. The sooner you seek help, the sooner treatment and detoxing can begin, and the easier it will be to stop the addiction from becoming worse or something serious occurring. As soon as you have observed there is a problem, it is important to check into our Ohio based Oxycodone detox center that knows exactly how to help in the best, most efficient, and safest way possible.

What happens during an Oxycodone detox?

During detox, it is usual to have a gradual reduction of the drug as opposed to complete cold turkey. It is usually done with an opioid treatment program and includes specific medications that trick the brain into thinking it is taking Oxycodone when it isn't. This can help to reduce certain symptoms and avoid others completely.

What is withdrawal from Oxycodone like?

The withdrawal process from Oxycodone can be an uncomfortable and potentially painful one, which is why it is important that it is conducted under the watchful eye of professionals. Symptoms tend to arise between eight and twelve hours after the last dose of Oxycodone has been taken, and the severity of them will depend on how much you usually take the drug. Those who don't tend to use it as much can experience less intense symptoms, while those who rely on it heavily can have it much harder.

Symptoms of Oxycodone withdrawal include:

- Fatigue
- Depression
- Diarrhea and Stomach Issues
- Sweating
- Muscles Aches
- Heart Palpitations
- Mood Swings
- Mood Swing
- Pain and AchingNausea and Vomiting

How long will the withdrawal process take?

The length of the withdrawal process will differ from person to person and depend on many factors. While there is no way to guarantee how your withdrawal symptoms and the journey will go, it can depend on:

- The length of time you have been taking Oxycodone
- How much Oxycodone you have taken
- How often you take Oxycodon
- If you have any pre-existing medical and mental health conditions
- How you took OxyCodone

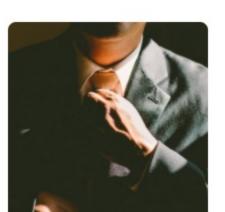

While symptoms first begin to show within a few hours of withdrawal, the worst physical symptoms appear about three to five days in. On days six to seven, the physical ones tend to subside, and psychological ones become worse. By day eight, the Oxycodone tends to have left the body, and it is important that mental health is monitored. This is because it is a time when many can be tempted to relapse or find themselves remorseful over things that they did while under the influence of the drug that they can look back on and see in a different light now. These feelings can cause severe anxiety and depression to occur.

If you or someone you love is addicted to Oxycodone, you can get it sorted today. Find out about the available detox treatments in Ohio sooner rather than later.
